

ROOT CANAL TREATMENT?

- ✓ A root canal is a treatment to **save a badly infected or painful tooth**.
- ✓ When this pulp gets infected due to **deep cavity, crack, or injury**, it causes severe pain.
- ✓ In root canal treatment, the dentist **removes the infected pulp** from inside the tooth.
- ✓ The inside of the tooth is then **cleaned, shaped, and disinfected**.
- ✓ After cleaning, the space is filled with a **safe, sealing material** to prevent infection.
- ✓ Finally, the tooth is restored with a **filling and often a crown (cap)** to strengthen it.
