

# CROWN AND BRIDGE

- ✓ **Crown Covers a Damaged Tooth**

A crown is a cap placed over a broken, weak, or root canal–treated tooth to protect it and make it strong.

- ✓ **Bridge Replaces Missing Teeth**

A bridge fills the gap created by one or more missing teeth by anchoring onto the nearby natural teeth.

- ✓ **They Look Like Natural Teeth**

Crowns and bridges are made to match your tooth colour, shape, and size, giving a natural appearance.

- ✓ **Helps in Proper Chewing and Speaking**

They restore the function of teeth, making chewing comfortable and improving speech.
